

Complete Virtualisation

Reduce costs and increase resilience through server virtualisation

As your business grows, the need for additional servers to run critical business applications can become very costly.

Not only do you have to purchase additional expensive server technology, but you also have to provide the floor space, power and cooling to keep these servers running.

Most servers do not run at full capacity and some, depending on their function, sit idle for a considerable part of the day, consuming electricity.

Virtualisation solves this problem by allowing businesses to have multiple virtual servers on a single piece of hardware. Complete I.T. are specialists in virtualisation technology and have many years of experience implementing and managing virtualised environments.

Virtual servers also offer significant benefits in terms of disaster recovery. Each virtual server instance can be backed up and restored almost anywhere – all of your data, settings and resources are bundled into the instance. In the event of a local disaster, you can restore all of your servers, applications and data almost anywhere, allowing you to get back up and running within a matter of minutes.

We partner with the top virtualisation vendors to ensure that we can utilise whichever technology best suits your situation.
