

# WHAT DO SHARP PLASMACLUSTERS DO?

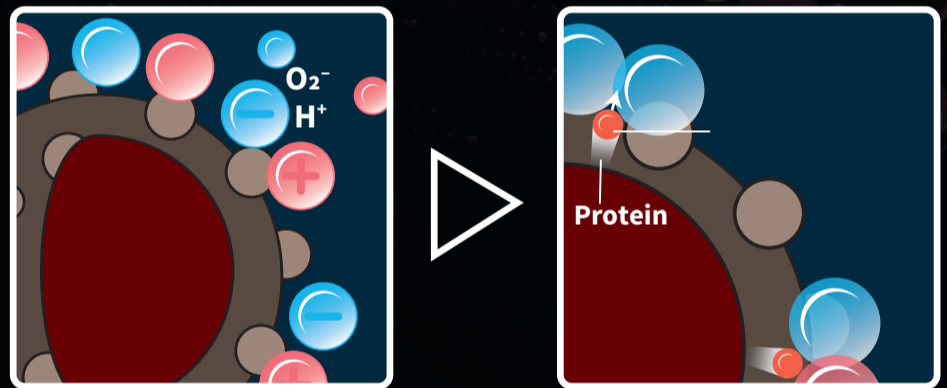

## 1. CATCH

Plasmacluster™ ions act as an air cleaning agent and are similar to positive and negative ions found in nature.

## 2. COLLECT

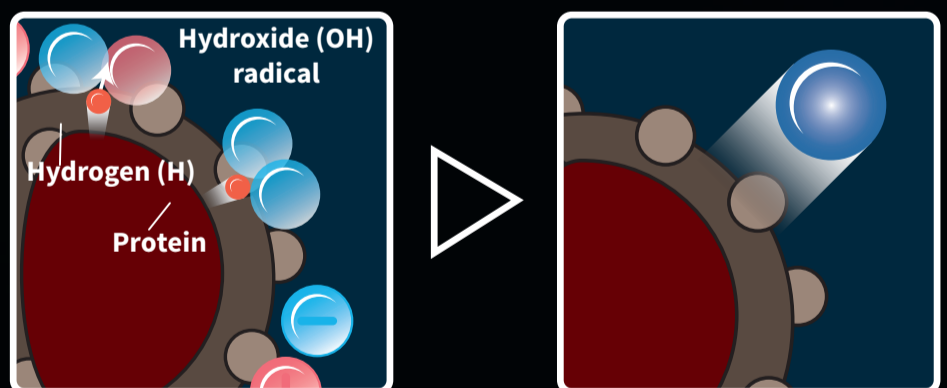

The ions adhere to the surface of airborne microbes. By removing hydrogen from the surface proteins, they break them down. Tiny dust particles are attracted to each other, they form larger particles and sink towards the ground. The fast airflow sucks all sinking particles into the purifier.

## 3. FILTER

The Filtration System filters out the particles and transforms the hydroxide radicals, combined with hydrogen, to form water, which is returned with the clean air to the room.
